Pixel Inventory Diary UI

Modern, cozy, cute pixel-art diary & inventory UI kit

A **modern, cozy, cute** pixel-art **diary & inventory** UI kit — plus modern-life item icons — for visual novels, modern-setting games, life-sims and more.

Every sprite is **hand-made** original pixel art. All scripts are **dependency-free** (no DOTween/LeanTween needed) and ship with a ready-to-use demo scene.

✨ Features

- **145 original pixel-art sprites** — every piece hand-drawn, no AI.
- **Hand-drawn pixel-art UI** — diary background, panels, buttons, progress bars, decorations and a large icon set (currency, food, daily, gadgets, gifts…).
- **Two page-turn methods** so both coders and non-coders are covered:
  - **Script** — `UISpriteFlipbook` + `DiaryPager` (cross-fade + frame animation).
  - **Animator** — a ready page-turn `AnimatorController` for a no-code workflow.
- **Lightweight tween engine** (`UITweener`) — scale / move / fade / rotate, 8 easings, `Bounce()` / `Pulse()` / `Shake()` presets, looping and an **in-editor preview**.
- **Cute-diary motion helpers** — staggered "pop-in" lists, count-up stat bars, idle floating decorations, tab-switch slides.
- **Tab system & shared pager routing** — multi-tab screens where one pair of Prev/Next buttons drives whichever page set is active.
- **Layered PSD source included** — recolor or tweak every icon and UI part to match your game.
- **Zero external dependencies** — only Unity UI (uGUI) + TextMeshPro.

```

Scripts

Script	Purpose
`UITweener`	Lightweight UI tween (scale/move/fade/rotate) with easings, presets and editor preview.
`UITweenStagger`	Plays child tweeners one-by-one for a "pop-in" list entrance.
`UISliderValueLabel`	Mirrors a Slider's value into a TMP label, with an optional count-up animation.
`DiaryPager`	Multi-page diary: cross-fades pages and plays the page-turn flipbook.
`PagerRouter`	Routes shared Prev/Next buttons to whichever pager is currently active.
`TabGroup`	Simple tab switcher (show/hide content, resize buttons, play tab tween).
`UISpriteFlipbook`	Frame-by-frame sprite animation on a UI Image (page-turn frames).
`NonDrawingGraphic`	Invisible, click-through-free hit area (raycast target, zero draw calls).

Prefabs

Drop-in prefabs so you can assemble a screen in seconds:

- **Screens** — `Screen_Diary_Full`, `Screen_inventory`, `Screen_Profile` (complete, ready-to-use screens)
- **Parts** — `Item_Slot`, `Progress` (reusable building blocks)
- **Buttons** — `Btn_Pink`, `Btn_Purple`, `Btn_Gray`
- **Icon previews** — `IconPreview_*` (category showcases to browse the whole icon set at a glance)

🚀 Getting Started

1. Import the package (requires **TextMeshPro** — accept the TMP Essentials prompt if asked).
2. Open `Demo/Demo.unity` to see the full diary/inventory UI in action.
3. Drag any prefab/sprite into your own Canvas, or copy pieces from the demo.

Common tasks

- **Add an entrance animation** — add `UITweener` to an object, enable a channel (Scale/Fade/...), turn on *Play On Enable*.
- **Make a list pop in** — add `UITweenStagger` to the list container; add a `UITweener` (Play On Enable **off**) to each item.
- **Page turning (script)** — add `DiaryPager`, assign your page objects to *Pages* and the flipbook to *Flipbook*; wire Prev/Next buttons to `Previous()` / `Next()` (or through `PagerRouter`).
- **Page turning (no code)** — use the Animator controller in `Animation/` instead.

🔧 Requirements

- **Unity 6000.3** (6.3) or newer
- **TextMeshPro** (built-in package)
- Works with **URP** and **Built-in** render pipelines (UI only — no custom shaders).

License

✓ CAN

- Use & remix in your games — personal or commercial
- Recolor / edit the PSD source freely

✗ CAN'T

- Resell or redistribute the assets themselves
- Use in Crypto / NFT projects
- Use for AI training or generation

100% hand-drawn art (no AI). Scripts AI-assisted, then hand-tested by me. No credit needed — go make something cool!
